Is ch<sub>3</sub>och<sub>3</sub> polar or nonpolar

Specify whether each of the following molecules is pole or nonpolar. (Please note that lonely couples have been left for simplicity!) H I - C - I Homework Equations Electronegativity, Polarity, Dipole moments Trial on Solution It seems to me like C and I have the same polarity so that the net polarity will be zero, but the answer says molecules are Polar. Why? Thank you for any help with the explanation! =) -Megan's response and No Replies, I am more electronegative than C because it is halogen. Note that molecules adopt a tetrahedral form. Either way, the time of the pole will go from between 2 C-H bonds I'm sorry I didn't get the last part of what you said. Do you think you can explain? =) Thank you! Read the dichloromethane in [Damaged] Last edited by moderator: May 4, 2017 Great link! Also, I have another question: 1) H3COCH3 H3CCH2CH3 It says that the first one has a higher boiling point because of the powers of dipole. Are there some kind of larger dipole between C and O? It looks like it might cancel it though? 2) C2H5OH CH3OCH3 Here, will it be the second, on a massive mass account, London Dispersion power becomes a factor that increases boiling point? thank you! I started getting this I thought!! =) -Megan Dan wait, do not say that the tetrahedral will cancel it?? Top Image Tetrachloromethane shows the density of bond electrons and the bottom image of dipole m molecule m = 0 D great link! Also, I have another question: 1) H3COCH3 H3CCH2CH3 It says that the first one has a higher boiling point because of the powers of dipole. Are there some kind of larger dipole between C and O? It looks like it might cancel it though? 2) C2H5OH CH3OCH3 Here, will it be the second, on a massive mass account, London Dispersion power becomes a factor that increases boiling point? thank you! I started getting this I thought!! =) -Megan 1) Yes, the dipole remains a permanent dipole (H3COCH3) stronger than the London Dispersal team (H3CCH2CH3). 2) BP should be C2H5OH (stronger hydrogen tie-) &gt; CH3OCH3 (pdpd) And wait, not say that tetrahedral will cancel it?? Top Image Tetrachloromethane shows the density of bond electrons and the bottom image of the dipole m molecule m = 0 D Yes, CCl4 will be a non-pole molecule. To continue enjoying our website, we ask that you verify your identity as a human being. Thank you very much for your cooperation. Is CH3OCH3 (Dimethyl ether) pole or nonpolar? CH3OCH3 (Dimethyl ether) is a Polar I'll tell you the polar or nonpolar list below. If Want to find the words you want to search for quickly, use Ctrl + F, then type the word you want to search for. List of polar molecules instead of polar Molecules 1-butanolPolar 1-propanolPolar 2-propanolPolar acetanilidePolar acetic acidPolar acetophenonePolar AgNO3 (Silver (Silver) )Polar Al2o3Polar Aldehyde
